How to read this: Each rate compounds the prior day's balance. A 2%/day target means each day you aim to grow your account by 2% of yesterday's ending balance. Targets are *profit goals*, not guarantees — actual results depend on win rate, risk per trade, and market conditions.

100-Day Daily Breakdown — \$10,000.00 starting balance

Days 1–100 split across four columns. Each cell shows the end-of-day balance under each compounding rate.

■ Highlighted rows = every 5th day milestone.

How This Works in Practice

Compound math is straightforward. Hitting these targets consistently is not.

What a daily target requires

Hitting 1–3% per day requires winning trades that net the target after losses. If your strategy has a 60% win rate and a 1.5R reward-to-risk ratio, you net positive expectancy of about 0.5R per trade. To make 2% per day with 1% risk per trade, you need ~4 net winning trades per day on a typical 5–8 trade pace.

Why drawdowns matter more than averages

A 20% drawdown requires a 25% gain to recover. A 40% drawdown requires a 67% gain. Daily compound math cuts both ways — losing 2% per day for 50 days reduces \$10,000 to about \$3,641.70. Position sizing and stop-loss discipline matter more than the daily target itself.

Realistic expectations

Most professional traders target **15–40% annualized** returns, not **2,600%+ in 100 days**. The compound table shows what's mathematically possible, not what's typically achievable. Treat these targets as aspirational ceilings — consistent execution at half these rates is exceptional.
